

## OBSERVATORY

The observatory contains auxillary controls and emergency systems for the spaceship. These back-up systems could control all ship operations in the event of an emergency. Here, too, are the remote programming controls for the robot and the robot power switch. The robot power-pak is also recharged in this area. To activate the robot its power-pak must be plugged into the robot and the robot power switch must be turned on. Once the robot has left its pedestal the power switch will have no effect.
